# Outlook for the Maltese economy

## Economic projections

2018-2020

*The Central Bank's latest projections foresee economic growth over the coming three years to remain strong from a historical perspective, though at lower but more sustainable levels than in 2017. These projections feature a downward revision in growth in 2018 and 2019 when compared to the previous set of forecasts, reflecting lower than anticipated outturns in the first quarter of 2018. Nevertheless, growth will remain high, supported by both demand and supply factors. In particular, the continued impact of the energy reforms, new investment projects and increased labour supply are expected to keep potential output elevated. Domestic demand, driven by higher consumption and investment, are anticipated to be the primary driver supporting the economic expansion over the next three years.*

*As a result of fast economic growth, the labour market is projected to remain tight, with the unemployment rate remaining low at 4.3% by 2019.*

*Annual inflation, based on the Harmonised Index of Consumer Prices (HICP), is projected to edge up to 1.9% by 2020, reflecting a pick-up in domestic wage pressures.*

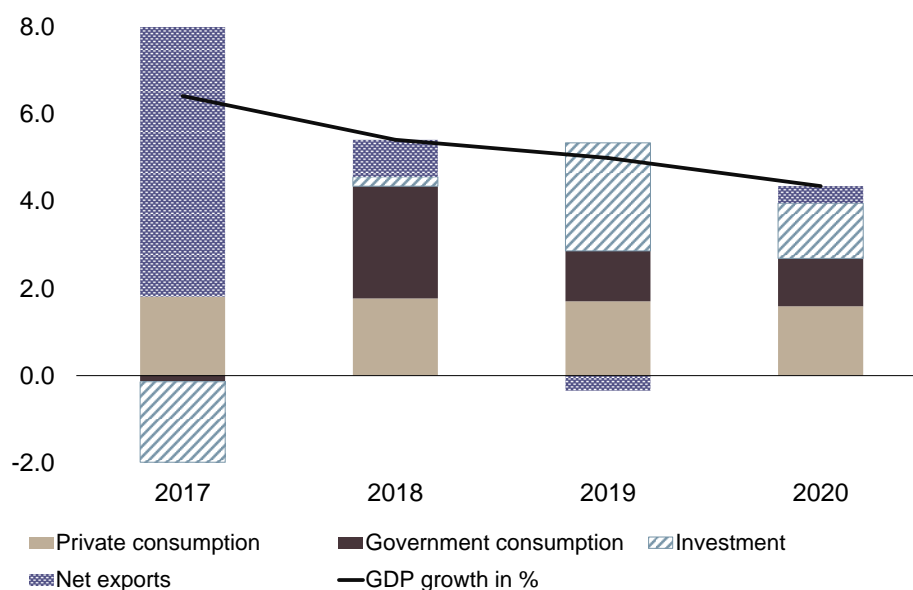

*With respect to public finances, projections for the general government balance have remained unchanged, as a downward revision in tax revenue and sales growth was offset by a downward revision in government investment and intermediate consumption. Government finances are expected to remain in surplus over the coming years. Meanwhile the debt-to-GDP ratio is projected to decline to around 40% by the end of the projection horizon.*

## 1 Economic outlook

The Central Bank's latest economic projections foresee economic growth over the coming three years to remain strong from a historical perspective, though at a lower but more sustainable levels than in 2017 (see Table 1).<sup>1</sup>

Compared with the Bank's previous projections published in June, GDP growth is being revised downwards in 2018 and 2019, partly due to lower than expected outturns in the first quarter of this year. In particular, private consumption growth surprised on the downside despite the strong growth in employment, which suggests that saving levels continued to rise. In addition, the growth in exports is envisaged to be lower than previously projected, reflecting in part some downward revisions in the forecast of Individual Investment Programme (IIP) flows, and weaker than expected goods exports in the first quarter of this year.

**Chart 1: GDP growth over the projection horizon**  
(percentage point contributions; annual percentage change)

Source: Central Bank of Malta

The dominant growth driver in 2017 was net exports, which reflected both a strong contraction in import-intensive private investment flows due to large base effects, and a continued decline in import shares. Conversely, during the period 2018-2020, domestic demand is forecast to become the main contributor towards economic growth due to a recovery in both private and government investment, while private consumption will remain buoyant (see Chart 1). Moreover, the increased fiscal space will allow government consumption to expand further. On the other hand, net exports are envisaged to

<sup>1</sup>The Bank's outlook for the Maltese economy is based on information available up to 31 July 2018 and is conditional on the June BMPE 2018 technical assumptions shown in Table 1, which are sourced from the European Central Bank. These projections were prepared by the Central Bank of Malta.

Table 1: Projections for the main macroeconomic aggregates for Malta<sup>1</sup>

	2017 <sup>2</sup>	2018	2019	2020
<b>Real economic activity (% change)</b>				
GDP	6.4	5.4	5.0	4.4
Private consumption expenditure	3.9	3.9	3.9	3.6
Government consumption expenditure	-0.9	17.0	6.9	6.4
Gross fixed capital formation	-7.6	1.0	12.2	5.8
Exports of goods and services	4.3	1.6	2.4	2.5
Imports of goods and services	-0.9	1.2	3.1	2.5

Oil price (USD per barrel)	54.4	74.5	73.5	68.7

<sup>1</sup> Data on GDP were sourced from NSO News Release 089/2018 published on 6 June 2018, while data for prices were sourced from NSO News Release 076/2018 and 079/2018 (released on 16 and 22 of May 2018).

<sup>2</sup> Actual data.

<sup>3</sup> Central Bank of Malta estimates.

<sup>4</sup> Data on the number of employed are consistent with national accounts data. The unemployment rate is based on the number of unemployed and employed as reported in the Labour Force Survey.

contribute positively in 2018 and 2020 but less than in the last few years as import shares are projected to stabilise. On the other hand, due to capital-intensive investment growth in 2019, the contribution of net exports for that year is envisaged to turn marginally negative.

The robust growth on the demand side should be supported by the supply side of the economy, reflecting continued increase in the labour supply due to net migrant flows, and efficiency gains. Potential output is projected to outpace GDP in 2020. Thus, the output gap is set to close by the end of the projection horizon.

Looking at the expenditure components in more detail, private consumption growth is set to remain dynamic over the projection horizon. The profile of private consumption mirrors the very large accumulation of savings in the last few years, and the projected development of real disposable income. The latter is set to decelerate over the projection horizon reflecting the expected easing of economic activity, but it is estimated to remain strong from a historical perspective and thus supportive of continued strong increases in private consumption. Furthermore, households are expected to unwind gradually their accumulated savings, particularly the increasing number of older households who are reaching retirement.

The profile of real government consumption is heavily influenced by inflows related to the IIP, which are netted against consumption expenditure. More details on projected developments in public consumption can be found in section 4.

The profile of investment is strongly influenced by the interplay of expected developments in specific sectors that have a bearing on private investment, as well as the expectation of increased absorption of EU funds, which conditions the profile of government investment. In 2018 private investment is projected to decrease marginally due to the completion of energy-related projects in 2017 and lower capital outlays in aviation. It is projected to recover strongly in 2019 and grow further in 2020 as investment in health-related projects is expected to pick up. Residential investment is foreseen to continue growing robustly but at a slower pace when compared to the last few years, as the pace of population increase is expected to slow down.

With regard to external trade, export growth is expected to decelerate in 2018 due to some weakness in goods exports and lower IIP flows. In addition, services exports other than those related to IIP flows are anticipated to slow down from very high growth rates in the last few years. On the other hand, goods exports are projected to recover in 2019 and 2020 in line with improved foreign demand. Nevertheless, the weakness in goods exports is envisaged to persist, and hence, these are foreseen to grow less rapidly than foreign demand.

Import growth is expected to turn positive in 2018 largely mirroring a lower decline in private investment

and a pick-up in goods exports. On the other hand, services imports should grow at a faster rate compared with 2017. Import growth is set to accelerate further in 2019, due to the recovery in private investment growth and the acceleration in goods exports. Moreover, during the projection horizon we continue to expect that the recent decline in import shares will stabilise at the current historic low levels.

As a result of the easing in the positive net export contribution, the trade surplus is expected to narrow over the projection horizon. In turn, primary income outflows should also contribute towards some moderation in the current account surplus over the next three years. However, due to the envisaged increase in EU funds, secondary income inflows are projected to rise.

## 2 Labour market

In line with the expected deceleration of economic activity over the period 2018-2020, the pace of employment growth is projected to ease somewhat. Nevertheless, both economic activity and growth in employment are expected to remain well above their historical average.

The Labour Force Survey (LFS) unemployment rate is expected to remain at record lows in 2018, in spite of continued increases in labour supply due to favourable net migration flows. Conversely, as employment growth and economic activity moderate in the following two years, the unemployment rate is foreseen to rise only slowly, and remain low from a historical perspective.

As regards wages, a national skills survey and contacts from industry continue to highlight that labour market tightness and wage pressures are gaining pace. In this context, and reflecting also an expected pick-up in consumer prices, growth in nominal compensation per employee is expected to accelerate over the projection horizon.

## 3 Prices

Against the background of the ECB's technical assumptions and the expected evolution of domestic cost pressures and economic activity, HICP inflation in Malta is set to accelerate gradually over the forecast horizon, reaching 1.9% by 2020 (see Chart 2).<sup>2</sup>

The international price of oil has shown strong growth during 2017. It is forecast to increase at an even faster pace in 2018, before easing in 2019 and 2020. This path influences the profile of the fuel and

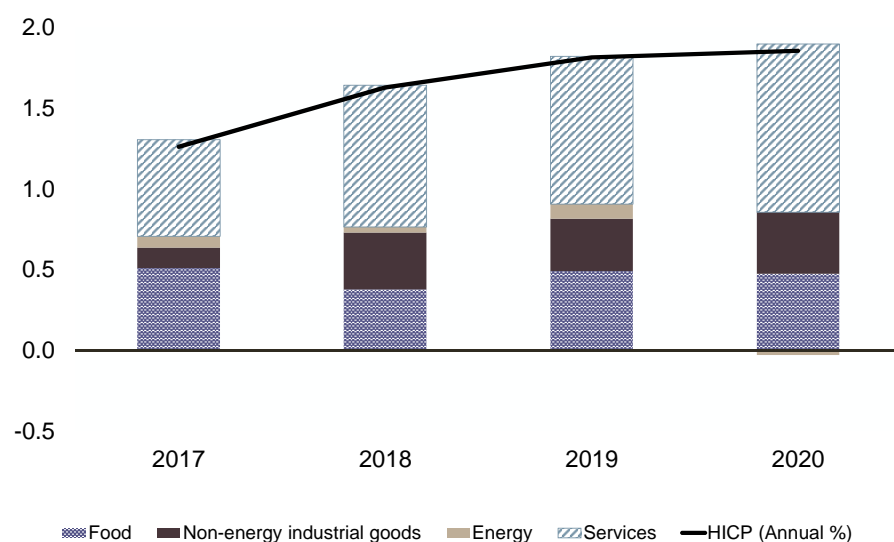

---

<sup>2</sup>This forecast is conditional on data on prices that were sourced from NSO News Release 076/2018 and 079/2018 (released on 16 and 22 of May 2018). Therefore, this section does not feature an update of the Bank's outlook on prices when compared with the projections released on 15 June 2018.

gas price projections through a lagged and impartial pass-through, while electricity prices are assumed to remain fixed during the forecast horizon as per government policy. Hence, energy inflation is set to remain positive in 2018 and 2019, before turning negative in 2020.

HICP excluding energy is projected to gradually accelerate to 2.0% by 2020. The acceleration in HICP excluding energy is foreseen to be primarily driven by faster growth in services prices, reflecting some intensification of demand and wage pressures. Inflation in non-energy industrial goods (NEIG) is also set to contribute to the rise in HICP excluding energy, mirroring a recovery in imported inflation. Food inflation is projected to remain robust throughout the forecast horizon.

**Chart 2: HICP inflation over the projection horizon**  
(percentage point contributions; annual percentage change)

Source: Central Bank of Malta

## 4 Public finance

The headline budget balance is expected to remain in surplus throughout the forecast horizon, sustained by large positive primary balances (see Table 2). However, the general government surplus is expected to decline from 3.9% of GDP in 2017 to 1.0% of GDP in 2020. This is due to forecast lower gross savings (i.e. the balance between current revenue and expenditure), mainly reflecting an assumed decline in IIP flows. In addition, a deterioration in the balance of capital expenditure net of capital revenue is set to deteriorate following a forecast increase in investment.

Compared with the Bank's earlier projections, the government balance outlook is unchanged, as a downward revision in tax revenue and sales growth was offset by a downward revision in government investment

and intermediate consumption. The general government debt-to-GDP ratio was revised slightly up, due to the downward revisions in GDP growth.

Overall, the share of tax revenue items in GDP is expected to decline compared with 2017. Although the share of current taxes on income and wealth in GDP is expected to increase, buoyed by higher income tax revenue from corporations, that of taxes on production and imports is expected to decline, driven by slower growth in consumption. Revenue from social contributions is also expected to increase at a smaller pace than GDP, in line with the provisions of Maltese law which limit these contributions.

Meanwhile, the share of other current revenue in GDP is also set to decline significantly. This is due to the forecast profile of income from the IIP, which is set to decline substantially from the high levels received in 2017.

Overall, growth in the main current spending items is expected to be restrained throughout the forecast period. The ratio to GDP of compensation of employees in GDP is set to remain broadly stable around the 2017 outcome. Meanwhile, growth in social payments is expected to remain slower than GDP growth, owing mostly to forecast low unemployment and an increase in the statutory retirement age in 2018, arising from the 2007 pension reform, which will limit pension expenditure growth that year. Intermediate consumption, subsidies and other current primary expenditure is forecast to grow in line with nominal GDP.

The shortfall in the balance between capital revenue and capital expenditure is expected to increase substantially in 2018 and to widen again in the outer year of the forecast period. The increased shortfall in 2018 partly reflects a one-time capital transfer reflecting the acquisition of landing rights by a government-owned company from Airmalta. Going forward, investment on domestically-funded projects is expected to pick up as work on nationwide road building projects gathers pace. Meanwhile, spending on projects which are partly-financed by EU funds under the 2014-2020 funding framework is also expected to increase compared with the outcome in 2017, albeit not by the same extent as domestically-funded outlays.

The Central Bank of Malta also produces estimates of the structural government balance, which measures the underlying budgetary position corrected for the economic cycle and temporary government measures. This is computed using a methodology applied within the ESCB<sup>3</sup>, which differs from the approach used by the Commission and the Maltese Government.

In the absence of significant temporary measures, the profile of the structural balance is determined by the extent to which the headline balance is influenced by the economic cycle. The Bank expects a positive cyclical component which declines slightly in 2020. Overall, the structural balance is set to

<sup>1</sup> CBM calculations based on NSO News Release 89/2018 (published on 5 June 2018) and News Release 104/2018 (published on 9 July 2018).

<sup>2</sup> Actual data.

<sup>3</sup> Mainly includes revenue from dividends, rents and sales.

<sup>4</sup> Mainly includes spending on education and contributions to the EU budget.

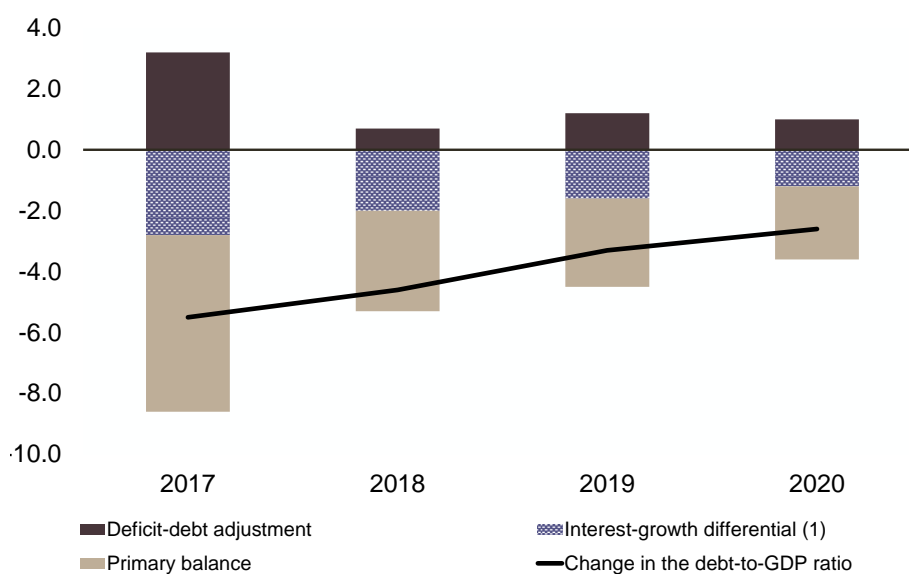

<sup>5</sup> Mainly includes grants from EU Programmes.

<sup>6</sup> Mainly reflects the value of changes in inventories and in the net acquisition of valuables and other assets.

decline from a surplus of 3.3% of GDP in 2017 to 0.5% of GDP by 2020, due to developments in the headline balance as outlined above. It is thus expected to remain above the medium-term budgetary objective of a balanced budget in structural terms.

The general government debt-to-GDP ratio is forecast to decline from 50.7% in 2017 to 40.3% by 2020, driven by high primary balances and a favourable interest-growth differential (see Chart 3).

## 5 Risks to the projections

Risks to the GDP growth projections are broadly balanced. Downside risks relate to the increased likelihood of protectionism and global uncertainties. In particular, an intensification of trade wars and uncertainties regarding Brexit would negatively impact export growth. Moreover, environmental and infrastructural constraints may become binding after a prolonged period of above average economic activity. On the other hand, there are upside risks if competitive gains in services exports and the decline in import shares persist. Private consumption may also surprise on the upside if the savings ratio falls more quickly towards its historical average, and if further declines in unemployment materialise.

Risks to inflation are on the upside, but this is mainly related to a change in the weight of accommodation prices rather than a fundamental change in inflation. On the other hand, a continuation of the current weak inflation environment in Malta's main trading partners could limit growth in import prices, which may in turn translate into weaker domestic inflationary pressures.

On balance, risks to the public finances tilt on the upside (i.e. balance-improving). On the one hand, revenue from the IIP might be lower than expected, especially in 2018. On the other hand, investment outlays may also be lower than expected, due to possible slippages in the implementation of locally-financed investment projects.
